

# Enriched-U Academic Partnership

Empowering Your Academic Success

## Summary

“Enriched-U” is a new academic partnership between Enriched Ag and select universities. The program provides:

- Free access to Enriched Ag’s cutting-edge and easy-to-use Insights platform to college students and faculty in the fields of livestock production and sustainable rangeland ecology and management.
- Ranch-level decision making for students to gain hands-on experience and broaden their skills to manage and monitor forage production and livestock demand.
- Hands-on training and demonstrations by Enriched Ag staff to show grazing management strategy outcomes using the innovative, web-based software tool.

## How It Works

Enriched Ag Insights uses remote sensing to build estimates of and monitor forage biomass accumulation, detect bareground differences from historical and current imagery, and provide historical and current weather information along with deviations from long-term normals. This allows users to estimate stocking rates, simulate herd rotations according to regrowth and recovery, and be alerted when a forage surplus or deficit occurs. Additionally, we offer insights on carbon storage potential and how it can change in relationship to grazing management practices.

Enriched Ag requests that participants share their findings and feedback with us at the end of each semester. Furthermore, we welcome possible collaboration opportunities, which could include our Enriched Ag Vision or Enriched Ag RealTime products, or joining forces with our research team for grant collaboration, manuscript writing and community outreach.
